NVIDIA QUADRO PASCAL GP107

Quadro Pascal GP107 is an enormous leap in processing power compared to the previous generation Maxwell GM107. It can provide up to 2.3 TFLOPS of CUDA processing at a very modest operating power, providing a huge improvement to 46 GFLOPS/Watt, making it an excellent choice for aerospace and defense applications. With its impressive processing power the board excels at data processing which benefits from advanced parallel processing, such as video stabilization, image processing, terrain analysis, object tracking or 3D visualization of geospatial data.

Quadro Pascal GPU architecture also provides a more powerful Unified Memory feature. Pascal's larger virtual memory address space enable GPUs to access the entire system memory plus the memory of all GPUs in the system, while the on-demand page migration engine allows the system to migrate pages from anywhere in the system to the GPU's memory for efficient processing. This improved memory handling results in significantly improved algorithm efficiency.
